PREFACE xv

Part I Urban Networks and Equilibrium 1

1 URBAN TRANSPORTATION NETWORKS ANALYSIS 2

- 1.1 **Equilibrium Analysis of Transportation Systems 4**
 - Systems approach to urban transportation, 4*
 - Equilibrium in markets, 6*
 - The transportation arena, 9*
- 1.2 **Network Representation 10**
 - Representation of the urban road network, 11*
 - Representation of the transit network, 13*
 - Centroids and connectors, 14*
 - Link performance functions, 16*
- 1.3 **Equilibrium over Urban Transportation Networks 18**
 - Definitions of equilibria, 18*
 - A simple user-equilibrium example, 20*
 - Outline, 23*
- 1.4 **Summary 24**
- 1.5 **Annotated References 25**
- 1.6 **Problems 25**

Part II User Equilibrium**27****2 BASIC CONCEPTS IN MINIMIZATION PROBLEMS 28**

- 2.1 Programs in One Variable 30
Unconstrained minimization programs, 30
Constrained minimization programs, 33
- 2.2 Multidimensional Programs 37
Unconstrained minimization programs, 37
Constrained minimization programs, 40
- 2.3 Some Special Programs 45
Nonnegativity constraints, 45
Linear equality constraints, 46
Nonnegativity and linear equality constraints, 48
More about Lagrangians, 49
Linear programs, 51
- 2.4 Summary 52
- 2.5 Annotated References 53
- 2.6 Problems 53

3 FORMULATING THE ASSIGNMENT PROBLEM AS A MATHEMATICAL PROGRAM 56

- 3.1 The Basic Transformation 59
- 3.2 Equivalency Conditions 63
- 3.3 Uniqueness Conditions 66
- 3.4 The System-Optimization Formulation 69
- 3.5 User Equilibrium and System Optimum 72
- 3.6 Summary 78
- 3.7 Annotated References 78
- 3.8 Problems 79

4 REVIEW OF SOME OPTIMIZATION ALGORITHMS 81

- 4.1 One-dimensional Minimization 81
Interval reduction methods, 82
Curve-fitting methods, 87
- 4.2 Multivariate Minimization 90
Unconstrained minimization algorithms, 92
Constrained minimization algorithms, 95

- 4.3 Convex Combinations Method 99
Algorithm, 99
Example, 104
- 4.4 Summary 107
- 4.5 Annotated References 108
- 4.6 Problems 108

5 SOLVING FOR USER EQUILIBRIUM 111

- 5.1 Heuristic Equilibration Techniques 111
Capacity restraint, 112
Incremental assignment, 115
- 5.2 Applying the Convex Combinations Method 116
- 5.3 Shortest Paths over a Network 122
Shortest-path algorithm, 122
Example, 124
Note on computer implementation, 125
- 5.4 Summary 129
- 5.5 Annotated References 130
- 5.6 Problems 131

Part III Extensions of User Equilibrium

133

6 USER EQUILIBRIUM WITH VARIABLE DEMAND 134

- 6.1 Equivalent Minimization Formulation 135
Motivation and interpretation, 136
Equivalence conditions, 137
Uniqueness conditions, 141
- 6.2 Solution Algorithm 141
- 6.3 Solution by Network Representation 146
The zero-cost overflow formulation, 146
The excess-demand formulation, 148
Example, 150
Computational considerations, 151
- 6.4 Mode Choice with Independent Modes 153
Equilibrium between modes, 154
Formulation and solution algorithm, 155
Example, 157
- 6.5 Summary 159
- 6.6 Annotated References 160
- 6.7 Problems 161

7 TRIP DISTRIBUTION AND TRAFFIC ASSIGNMENT MODELS 164

- 7.1 The UE Distribution/Assignment Problem 165
 - Problem formulation, 166*
 - Algorithm, 168*
 - Solution by network representation, 169*
- 7.2 Distribution/Assignment with Destination Demand Functions 171
 - Distribution/assignment with logit functions, 172*
 - Direct algorithm and solution by network representation, 174*
 - Example, 176*
 - Computational issues, 178*
 - Double-stage algorithm, 179*
- 7.3 Doubly Constrained Models 180
 - Entropy model, 182*
 - Solution by the convex combinations algorithm, 185*
 - Double-stage algorithm, 187*
 - Evaluation, 188*
- 7.4 Solving Hitchcock's Transportation Problem 189
- 7.5 Summary 197
- 7.6 Annotated References 198
- 7.7 Problems 198

8 EQUILIBRIUM WITH LINK INTERACTIONS 203

- 8.1 Two-Way Traffic Interactions 204
 - Equivalency conditions, 205*
 - Uniqueness conditions, 207*
 - Algorithm, 209*
 - Example, 209*
 - Extensions, 212*
- 8.2 Equilibrium with Asymmetric Cost Functions 214
 - Algorithm, 215*
 - Proof of solution, 216*
 - Example, 218*
 - Convergence considerations and a streamlined algorithm, 220*
 - Example and comparison of algorithms, 224*
- 8.3 Summary 227
- 8.4 Annotated References 228
- 8.5 Problems 229

9 SUPERNETWORKS—MODELS OF JOINT TRAVEL CHOICES 231

- 9.1 Modal Split in Mixed Traffic—Extensions 232
Mode split with full transit network, 232
Mode split with interdependent modes, 238
Non-UE transit assignment, 242
- 9.2 Joint Travel Decisions and Supernetworks 246
Joint modal split/distribution/assignment model, 246
Joint modal split/distribution/assignment model with variable demand, 251
Analysis of supernetworks, 253
- 9.3 Summary 255
- 9.4 Annotated References 256
- 9.5 Problems 256

Part IV Stochastic User Equilibrium

261

10 DISCRETE CHOICE MODELS AND TRAFFIC ASSIGNMENT 262

- 10.1 Review of Discrete Choice Models 262
Choice function, 263
Multinomial logit, 264
Multinomial probit, 266
The satisfaction function, 269
Aggregate predictions, 270
- 10.2 Stochastic Network Loading 271
Route choice, 272
Another paradox of traffic flow, 275
The expected perceived travel time, 278
The nature of the flow variables, 280
- 10.3 Summary 282
- 10.4 Annotated References 283
- 10.5 Problems 284

11 STOCHASTIC NETWORK LOADING MODELS 286

- 11.1 Logit-Based Loading Models 286
STOCH algorithm, 288
Critique of logit-based network loading, 294

| | | |
|---------------|---|--------------------|
| 11.2 | Probit-Based Loading Models | 297 |
| | <i>Derivation of perceived path travel times,</i> | <i>298</i> |
| | <i>Algorithm,</i> | <i>300</i> |
| | <i>Comparison of probit and logit loading</i> | <i>models, 302</i> |
| 11.3 | Summary | 305 |
| 11.4 | Annotated References | 306 |
| 11.5 | Problems | 306 |
| 12 | STOCHASTIC USER EQUILIBRIUM | 309 |
| 12.1 | SUE Equivalent Minimization | 312 |
| | <i>Program formulation,</i> | <i>312</i> |
| | <i>Equivalence conditions,</i> | <i>316</i> |
| | <i>Uniqueness conditions,</i> | <i>318</i> |
| 12.2 | Solution Algorithm | 322 |
| | <i>Method of successive averages,</i> | <i>324</i> |
| | <i>Example,</i> | <i>328</i> |
| 12.3 | More About Stochastic User Equilibrium | 332 |
| | <i>Computational trade-offs for probit-based</i> | <i>SUE, 332</i> |
| | <i>SUE with link interactions,</i> | <i>335</i> |
| | <i>Note on methodology selection,</i> | <i>336</i> |
| | <i>Joint travel choices and hypernetworks,</i> | <i>339</i> |
| 12.4 | Summary | 341 |
| 12.5 | Annotated References | 341 |
| 12.6 | Problems | 343 |
| Part V | Input Data | 345 |
| 13 | BACKGROUND FOR DEVELOPING THE ANALYSIS | |
| | INPUTS | 346 |
| 13.1 | Link Performance Functions | 346 |
| | <i>Traffic flow models,</i> | <i>347</i> |
| | <i>Delay at signalized intersections,</i> | <i>351</i> |
| | <i>Delay at unsignalized intersections,</i> | <i>354</i> |
| | <i>Common link performance functions,</i> | <i>358</i> |
| 13.2 | Estimation of Demand Function | |
| | Parameters | 360 |
| | <i>Curve fitting and least squares,</i> | <i>360</i> |
| | <i>Maximum likelihood,</i> | <i>362</i> |
| | <i>Estimating the parameters of discrete choice</i> | <i>models, 364</i> |

- 13.3 Estimation of O-D Matrices 367
 - O-D matrices that reproduce observed conditions, 368*
 - Choosing the appropriate matrix, 369*
- 13.4 Summary 372
- 13.5 Annotated References 373
- 13.6 Problems 374

APPENDIX: NORMAL DISTRIBUTION AND PROBIT ANALYSIS 377

- A.1 Multivariate Normal Distribution 377
- A.2 Multinomial Probit Model 379
 - Approximation method, 379*
 - Simulation method, 381*
